# Metrics of positive curvature with conic singularities on compact surfaces

## Abstract

Let  $S$  be a compact Riemann surface,  $A = (a_1, \dots, a_n)$  points in  $S$  and  $\alpha_1, \dots, \alpha_n$  positive numbers. Consider Riemannian metrics of constant curvature  $\kappa$  on  $S \setminus A$  with conic singularities with angles  $2\pi\alpha_j$  at  $a_j$ ,  $1 \leq j \leq n$ . The main question is how to describe the set of all such metrics. These questions were completely settled in 19th century for  $\kappa \leq 0$ , but are still wide open for  $\kappa > 0$ . The question is equivalent to description of the set of solutions of the differential equation

$$\Delta u + \kappa e^{2u} = 0$$

on  $S \setminus A$  with prescribed singularities at the points of  $A$ . The subject is also related to geometry and analytic theory of linear ODE. A survey of recent results on this problem will be given.
